```
struct uno Environment
     a name for this environment
       rtl String * pName;
    A free context pointer, that can be used for specific classes of environments, e.g.
       a jvm pointer
       void * pContext;
/** Acquires this environment.
              @param pEnv this interface
*/
       void (SAL CALL * acquire)( uno Environment * pEnv );
/** Releases this environment; Last release of environment revokes the environment
       from runtime.
              @param pAccess this access interface
*/
       void (SAL CALL * release)( uno Environment * pEnv );
    Tests if two environments are equal.
              @param pEnv1 one environment
              @param pEnv2 another environment
*/
       sal Bool (SAL CALL * equals) (const uno Environment* pEnv1, const
              uno Environment * pEnv2);
/**
* You register internal and external interfaces via his method. Internal interfaces are
       proxies that are used in an environment. External interfaces are interfaces
       that are exported to another environment, thus providing an object identifier
       for this task. This can be called an external reference. Interfaces are held
       weakly at an environment; they demand a final revokeInterface()call for each
       interface that has been registered.
              @param pEnv this environment
              @param ppInterface inout parameter for the registered interface
              @param ppOId inout parameter for the corresponding object id
              @param pTypeDescr type description of interface
              @param acquire function to acquire an interface; this function
                     provides a boolean return value to signal if the acquisition was
                     successful (necessary for proxy interfaces)
*/
